

Lecture 03 - Morphology

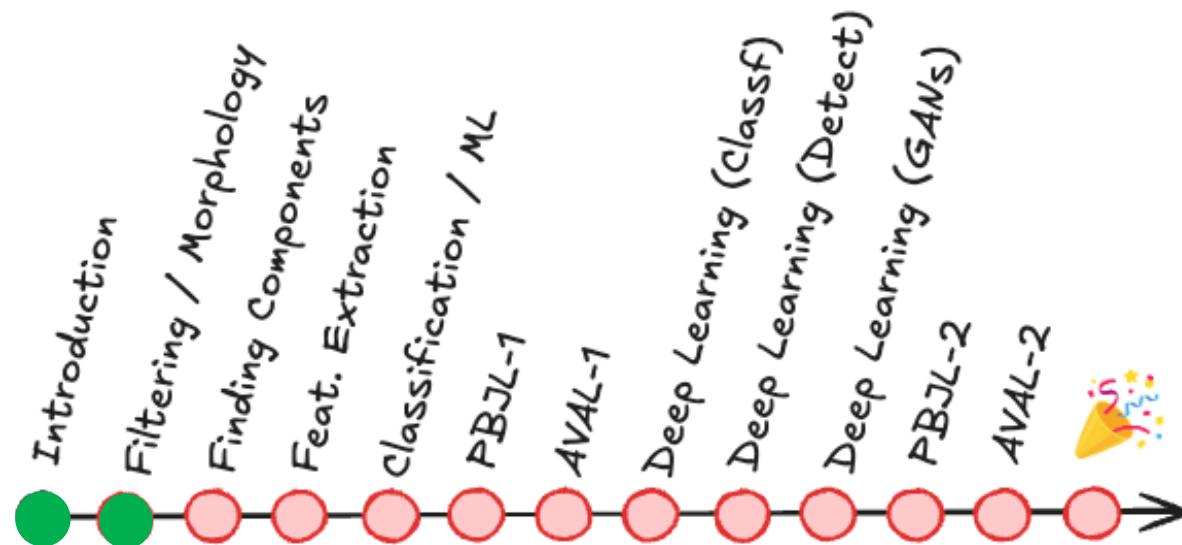

Prof. André Gustavo Hochuli

gustavo.hochuli@pucpr.br

aghochuli@ppgia.pucpr.br

Topics

- Discussion of Practice 02
- Mathematical Morphology
 - Structuring Element (or Kernel)
 - Erode / Dilate
 - Open / Close
 - Gradients
 - Watershed
- Practice

Mathematical Morphology

- Morphology (Nature): Branch of Biology that study the form and structure of animals and plants
- Morphology (Image Processing): Mathematical operations to extract image components based on pixel neighborhood.
- Increase/Decrease Objects Size, Reduce Noise, Closing or Open (GAPS)

Structuring Element (Kernel)

- Defines the shape of the structure to be applied
- The structure is slid through the image
- Erosion or Dilate operations are applied
- The origin determines the pixel be changed

Erosion

- Moves one's to zero's
- Binary 'AND' Operation
- Reduces Noises and Contours

Dilation

- Moves zero's to one's
- Binary 'OR' Operation
- Increases Objects, connects contours, and fill holes.

Opening and Closing

- Combined morphological operations that preserve the shape and size of large objects in the image
 - Opening: Erode + Dilate
 - Removes small objects, noises, and thin lines
 - Closing: Dilate + Erode
 - Fill small holes and connect segmented contours

Others Morphological Operations

- Gradient: Dilate - Erosion
 - Outline de Object

- TopHat: Open – Original Image
 - Reduce the effect of brightness changes
 - Isolates brightness objects

Let's code!
